## Practice, confidence intervals

1. Confidence interval for the population mean ( $\mu$ ), if population standard deviation ( $\sigma$ ) is known.
1.1.The mean height of first year pharmaceutical students is 175 cm with $\mathrm{SD}=10$. Let' s suppose the height follow normal distribution with these parameters.
a) What percentage of the height is above 175 cm .....
b) What percentage of the height is below 175 cm ? $\mathrm{P}($ height $<175)=$ $\qquad$
c) What percentage of the height are between 155 and 195?
d) What percentage of the height is below 155 cm ?
1.2. Calculate the mean and standard error of mean of a sample of 36 cases derived from this population Mean. $\qquad$ S.E. $\qquad$
1.3 The mean of another random sample with 36 number of cases is 172 and $\mathrm{SD}=10$. Calculate the $95 \%$ confidence interval

What is the meaning of the $95 \%$ CI? $\qquad$
Compare the population mean (175) with the $95 \%$ CI calculated. It is included in the $95 \% \mathrm{CI}$ ? $\qquad$
2. Confidence interval for the population mean ( $\mu$ ), if population standard deviation ( $\sigma$ ) i unknown.
2.1. (Example from Altman). In a trial we actually observed a mean serum albumin of $34.46 \mathrm{~g} / \mathrm{l}$ with a standard error of $1.273 \mathrm{~g} / \mathrm{l}$ from a sample of 21 patients with primary biliary cirrhosis. Find the $95 \%$ confidence interval.
$\alpha=$
$\mathrm{N}=$
Mean=
SE=
Degrees of freedom=
$\mathrm{t}_{\alpha}=$
Mean- $\mathrm{t}_{\alpha} \mathrm{SE}=\quad$ Mean $+\mathrm{t}_{\alpha} \mathrm{SE}=$
Confidence interval:
Meaning:
P(.. .$<$ true population mean< $\qquad$ .) $=0.95$
We can be $95 \%$ confident from this study that the true mean serum albumin among all such patients lies somewhere in the range 31.8 to $37.1 \mathrm{~g} / \mathrm{l}$, with 34.46 as our best estimate. This interpretation depends on the assumption that the sample of 21 patients is representative of all patients with the disease.
2.2. Find the $99 \%$ confidence interval
$\alpha=$
$\mathrm{N}=$
Mean=
SE=
Degrees of freedom=
$\mathrm{t}_{\alpha}=$
Mean- $\mathrm{t}_{\alpha} \mathrm{SE}=\quad$ Mean $+\mathrm{t}_{\alpha} \mathrm{SE}=$
Confidence interval:
Meaning:
P(. <true population mean< ) $=0.99$
2.3. Suppose that the above data were observed from a sample of 216 patients. Find the $95 \%$ confidence interval.
$\alpha=$
$\mathrm{N}=$
Mean=
SE=
Degrees of freedom=
$\mathrm{t}_{\alpha}=$
Mean- $\mathrm{t}_{\alpha} \mathrm{SE}=\quad$ Mean $+\mathrm{t}_{\alpha} \mathrm{SE}=$
Confidence interval:
Meaning:
P(. $\qquad$ <true population mean< $\qquad$ .) $=0.95$
2.4. In a study, systolic blood pressure of 10 healthy women was measured. The mean was 119 , the standard error 0.664 . Calculate the $95 \%$ confidence interval for the population mean!
$\left(\alpha=0.05, \mathrm{t}_{\mathrm{tabla}}=2.26\right)$.
2.5. In a study, systolic blood pressure of 10 healthy women was measured. The mean was 119 , the standard error 2.1. Calculate the $95 \%$ confidence interval for the population mean!
$\left(\alpha=0.01, \mathrm{t}_{\mathrm{tabla}}=2.26\right)$.
Compare the lenght of this last confidence interval to the earlier one (in Problem 2.4.).
..................... Explain $\qquad$

## Questions

1. Which is wider, a $95 \%$ or a $99 \%$ confidence interval?
2. When you construct a $95 \%$ confidence interval, what are you $95 \%$ confident about?
3. When computing a confidence interval, when do you use $t$-table and when do you use $u$ ?

## Practice with SPSS:

Open the data file of the questionnaire filled out by the students in SPSS! (Data:E/Data/Biostat=kerd??.sav) or QUEST2010.sav.

1. Examine the distribution of "age"!

Find the $95 \%$ CI.
Find the 99\% CI.
With $95 \%$ probability, can we state that the mean age in the population of students is 20 ? $\qquad$
Explain
With $99 \%$ probability, can we state that the mean age in the population of students is 20 ? $\qquad$
Explain...............2. Examine the distribution of "body height" for boys and girls!
Find the 95\% CI for boys
girls
Find the $99 \%$ CI for boys
girls
With $95 \%$ probability, can we state that the mean body height in the population of girls is 160 cm ? $\qquad$
Explain
With $95 \%$ probability, can we state that the mean body height in the population of boys is 160 cm ? $\qquad$
Explain $\qquad$
With $99 \%$ probability, can we state that the mean body height in the population of girls is 160 cm ? $\qquad$ Explain. $\qquad$
With $99 \%$ probability, can we state that the mean body height in the population of boys is 160 cm ? $\qquad$
Explain. $\qquad$
