## Statistical estimation, confidence intervals

## The central limit theorem

## Distribution of sample means

## http://onlinestatbook.com/stat sim/sampling dist/index.htm|

## The population is not normally distributed

## The central limit theorem

- If the sample size $n$ is large (say, at least 30), then the population of all possible sample means approximately has a normal distribution with mean $\mu$ and standard deviation $\frac{\sigma}{\sqrt{n}}$ no matter what probability
describes the population sampled

## The prevalence of normal distribution

- Since real-world quantities are often the balanced sum of many unobserved random events, this theorem provides a partial explanation for the prevalence of the normal probability distribution.

## Tha standard error of mean (SE or SEM)

 is called the standard error of mean- Meaning: the dispersion of the sample means around the (unknown) population mean.

## Calculation of the standard error from the standard deviation when $\sigma$ is unknown

- Given $x_{1}, x_{2}, x_{3}, \ldots, x_{n}$ statistical sample, the stadard error can be calculated by

$$
S E=\frac{S D}{\sqrt{n}}=\sqrt{\frac{\sum_{i=1}^{n}\left(x_{i}-\bar{x}\right)^{2}}{n(n-1)}}
$$

- It expresses the dispersion of the sample means around the (unknown) population mean.

## Mean-dispersion diagrams

- Mean + SD
- Mean + SE
- Mean + 95\% CI

Mean $\pm 95 \% \mathrm{Cl}$
Mean $\pm$ SD

## Statistical estimation

## Statistical estimation

- A parameter is a number that describes the population (its value is not known).
- For example:
- $\mu$ and $\sigma$ are parameters of the normal distribution $N(\mu, \sigma)$
- $n, p$ are parameters of the binomial distribution
- $\lambda$ is parameter of the Poisson distribution
- Estimation: based on sample data, we can calculate a number that is an approximation of the corresponding parameter of the population.
- A point estimate is a single numerical value used to approximate the corresponding population parameter.
- For example, the sample mean is an estimation of the population's mean, $\mu$.

$$
\begin{gathered}
\bar{x}=\frac{x_{1}+x_{2}+\ldots+x_{n}}{n}=\frac{\sum_{i=1}^{n} x_{i}}{n}
\end{gathered} \text { approximates } \mu
$$

## Interval estimate, confidence interval

- Interval estimate: a range of values that we think includes the true value of the population parameter (with a given level of certainty).
- Confidence interval: an interval which contains the value of the (unknown) population parameter with high probability.
- The higher the probability assigned, the more confident we are that the interval does, in fact, include the true value.
- The probability assigned is the confidence level (generally: 0.90, 0.95, 0.99 )

## Interval estimate, confidence interval (cont.)

- „high" probability: the probability assigned is the confidence level (generally: $0.90,0.95,0.99$ ).
- „small" probability: the „error" of the estimation (denoted by $\alpha$ ) according to the confidence level is

$$
1-0.90=0.1,1-0.95=0.05,1-0.99=0.01
$$

- The most often used confidence level is
95\% (0.95),
- so the most often used value for $\alpha$ is

$$
\alpha=0.05
$$

## The confidence interval is based on the concept of repetition of the study under consideration

- If the study were to be repeated 100 times, of the 100 resulting 95\% confidence intervals, we would expect 95 of these to include the population parameter.

## Settings: $\mathbf{1 0 0 0}$ samples

Result of the last 100

## Formula of the confidence interval

 for the population's mean $\mu$ when $\sigma$ is known- It can be shown that

$$
\left(\overline{\mathrm{x}}-u_{\alpha / 2}\left(\frac{\sigma}{\sqrt{n}}\right) \quad \bar{x}+u_{\alpha / 2}\left(\frac{\sigma}{\sqrt{n}}\right)\right.
$$

is a (1- $\alpha$ ) $100 \%$ confidence interval for $\mu$.

- $\mathrm{u}_{\alpha / 2}$ is the $\alpha / 2$ critical value of the standard normal distribution, it can be found in standard normal distribution table
for $\alpha=0.05 u_{\alpha / 2}=1.96$
for $\alpha=0.01 u_{\alpha / 2}=2.58$
- $95 \% \mathrm{Cl}$ for the population's mean

$$
\left(\bar{x}-1.96 \frac{\sigma}{\sqrt{n}}, \quad \bar{x}+1.96 \frac{\sigma}{\sqrt{n}}\right)
$$

## The standard error of mean (SE or SEM)

- $\sigma$is called the standard error of mean

■ Meaning: the dispersion of the sample means around the (unknown) population's mean.

- When $\sigma$ is unknown, the standard error of mean can be estimated from the sample by: $\underline{S D}$
$n$

$$
\frac{\sigma}{\sqrt{n}} \approx \frac{S D}{\sqrt{n}}=\frac{\text { standard deviation }}{\sqrt{n}}
$$

## Example

- We wish to estimate the average number of heartbeats per minute for a certain population
- Based on the data of 36 patients, the sample mean was 90, and the sample standard deviation was 15.5 (supposed to be known). Assuming that the heart-rate is normally distributed in the population, we can calculate a $95 \%$ confidence interval for the population mean:
- $\alpha=0.05, u_{\alpha / 2}=1.96, \sigma=15.5$
- The lower limit

$$
90-1.96 \cdot 15.5 / \sqrt{ } 36=90-1.96 \cdot 15.5 / 6=90-5.063=84.937
$$

- The upper limit

$$
90+1.96 \cdot 15.5 / \sqrt{ } 36=90+1.96 \cdot 15.5 / 6=90+5.063=95.064
$$

- The $95 \%$ confidence interval is

$$
\text { - } \quad(84.94,95.06)
$$

- We can be $95 \%$ confident from this study that the true mean heart-rate among all such patients lies somewhere in the range 84.94 to 95.06 , with 90 as our best estimate. This interpretation depends on the assumption that the sample of 36 patients is representative of all patients with the disease.

## Formula of the confidence interval for the population's mean when $\sigma$ is unknown

- When $\sigma$ is unknown, it can be estimated by the sample SD (standard deviation). But, if we place the sample SD in the place of $\sigma, u_{\alpha / 2}$ is no longer valid, it also must be replace by $\mathrm{t}_{\mathrm{\alpha} / 2}$. So

$$
\left(\overline{\mathrm{x}}-t_{\alpha / 2} \frac{S D}{\sqrt{n}}, \quad \bar{x}+t_{\alpha / 2} \frac{S D}{\sqrt{n}}\right)
$$

is a (1- $\alpha$ )100 confidence interval for $\mu$.

- $t_{\alpha / 2}$ is the two-tailed $\alpha$ critical value of the Student's $t$ statistic with $n-1$ degrees of freedom (see next slide)

## $t$-distributions (Student's t-distributions)

## Example 1.

- We wish to estimate the average number of heartbeats per minute for a certain population.
- The mean for a sample of 13 subjects was found to be 90, the standard deviation of the sample was $S D=15.5$. Supposed that the population is normally distributed the $95 \%$ confidence interval for $\mu$ :
- $\alpha=0.05, \mathrm{SD}=15.5$
- Degrees of freedom: $\mathrm{df}=\mathrm{n}-1=13-1=12$
- $\mathrm{t}_{\alpha / 2}=2.179$
- The lower limit is

$$
90-2.179 \cdot 15.5 / \sqrt{ } 13=90-2.179 \cdot 4.299=90-9.367=80.6326
$$

- The upper limit is

$$
90+2.179 \cdot 15.5 / \sqrt{ } 13=90+2.179 \cdot 4.299=90+9.367=99.367
$$

- The $95 \%$ confidence interval for the population mean is (80.63, 99.36)
- It means that the true (but unknown) population means lies it the interval $(80.63,99.36)$ with 0.95 probability. We are $95 \%$ confident the true mean lies in that interval.

## Example 2.

- We wish to estimate the average number of heartbeats per minute for a certain population.
- The mean for a sample of 36 subjects was found to be 90, the standard deviation of the sample was $S D=15.5$. Supposed that the population is normally distributed the $95 \%$ confidence interval for $\mu$ :
- $\alpha=0.05, S D=15.5$
- Degrees of freedom: $\mathrm{df}=\mathrm{n}-1=36-1=35$
- $\mathrm{t} \alpha / 2=2.0301$
- The lower limit is

$$
90-2.0301 \cdot 15.5 / \sqrt{ } 36=90-2.0301 \cdot 2.5833=90-5.2444=84.755
$$

- The upper limit is

$$
90+2.0301 \cdot 15.5 / \sqrt{ } 36=90+2.0301 \cdot 2.5833=90+5.2444=95.24
$$

- The $95 \%$ confidence interval for the population mean is (84.76, 95.24)
- It means that the true (but unknown) population means lies it the interval (84.76, 95.24) with 0.95 probability. We are $95 \%$ confident that the true mean lies in that interval.

## Comparison

- We wish to estimate the average number of heartbeats per minute for a certain population.
- The mean for a sample of 13 subjects was found to be 90, the standard deviation of the sample was $\mathrm{SD}=15.5$. Supposed that the population is normally distributed the $95 \%$ confidence interval for $\mu$ :
- $\alpha=0.05, S D=15.5$
- Degrees of freedom: $\mathrm{df}=\mathrm{n}-1=13-1=12$
- $\mathrm{t}_{\alpha / 2}=2.179$
- The lower limit is

$$
\begin{aligned}
& 90-2.179 \cdot 15.5 / \sqrt{ } 13=90-2.179 \cdot 4.299=90- \\
& 9.367=80.6326
\end{aligned}
$$

- The upper limit is

$$
\begin{gathered}
90+2.179 \cdot 15.5 / \sqrt{ } 13=90+2.179 \\
\cdot 4.299=90+9.367=99.367
\end{gathered}
$$

- The $95 \%$ confidence interval for the population mean is
(80.63, 99.36)
- We wish to estimate the average number of heartbeats per minute for a certain population.
- The mean for a sample of 36 subjects was found to be 90, the standard deviation of the sample was $S D=15.5$. Supposed that the population is normally distributed the $95 \%$ confidence interval for $\mu$ :
- $\alpha=0.05, S D=15.5$
- Degrees of freedom: $\mathrm{df}=\mathrm{n}-1=36-1=35$
- $t \alpha / 2=2.0301$
- The lower limit is

$$
\begin{gathered}
90-2.0301 \cdot 15.5 / \sqrt{ } 36=90-2.0301 \\
\cdot 2.5833=90-5.2444=84.755
\end{gathered}
$$

- The upper limit is

$$
\begin{gathered}
90+2.0301 \cdot 15.5 / \sqrt{ } 36=90+2.0301 \\
\cdot 2.5833=90+5.2444=95.24
\end{gathered}
$$

- The $95 \%$ confidence interval for the population mean is
(84.76, 95.24)

## Review questions and problems

- The central limit theorem
- The meaning and the formula of the standard error of mean (SE)
- The meaning of a confidence interval
- The confidence level
- Which is wider, a $95 \%$ or a $99 \%$ confidence interval?
- Calculation of the confidence interval for the population mean in case of unknown standard deviation
- Studenst's t-distribution
- In a study, systolic blood pressure of 16 healthy women was measured. The mean was 121, the standard deviation was $\mathrm{SD}=8.2$. Calculate the standard error.
- In a study, systolic blood pressure of 10 healthy women was measured. The mean was 119, the standard error 0.664 . Calculate the $95 \%$ confidence interval for the population mean!
$\left(\alpha=0.05, t_{\text {table }}=2.26\right)$.
